FOR IMMEDIATE RELEASE

A modern solution for age-old boat covering challenges

The Shelter system in action

Amsterdam, November 6th 2023 - A modern twist to traditional boat covering is making waves in the maritime industry. The new shelter system, a revolutionary boat covering solution, elegantly combines functionality with user-friendly design.

The essence of the shelter lies in its inflatable frame, a unique concept that offers boat owners a streamlined process of covering their vessels. Unlike the conventional metal frames, this air-powered design significantly reduces the environmental footprint. The switch from materials like aluminium and stainless steel to a more sustainable solution is a testament to the company's commitment to eco-friendly innovations.

User-centricity is at the heart of the SHELTAIR's design. Ease of use is the most prominent feature, making it notably different from conventional boat covers. The design ensures that boat owners spend less time fiddling with cumbersome covers which leaves them with more time to enjoy their maritime experience.

The use of a parametrical design tool during the production process adds another layer of precision to the shelter. It ensures a custom fit for each boat, increasing its efficacy in protecting the vessel against harsh weather conditions.

MARIN'R

In real-world conditions, SHELTAIR has demonstrated resilience and durability, holding its own against strong winds of up to 60 km/h, torrential rains, and even waves. This robust performance, combined with its environmentally-conscious design and user-focused features, is set to make SHELTAIR an added value for every boat owner.

The maritime industry, rooted in tradition, often approaches new technological innovations with caution. However, given the evident advantages of the shelter system, even the most traditional boaters might find it hard to resist this contemporary solution.
